

四、稳定平衡位置附近的运动

围绕平衡位置的微振动

势能 $E_p = E_p(x)$

平衡位置： $x=0$ ，势能最小（极小值）

$$\left. \frac{dE_p}{dx} \right|_{x=0} = 0, \quad \left. \frac{d^2 E_p}{dx^2} \right|_{x=0} > 0$$

相应作用力： $F(x) = -\frac{dE_p}{dx}$

平衡位置 ($x=0$) 附近， $F(x)$ 作泰勒级数展开

$$F(x) = F(0) + \left. \frac{dF}{dx} \right|_{x=0} \cdot x + \frac{1}{2} \left. \frac{d^2 F}{dx^2} \right|_{x=0} \cdot x^2 + \dots$$

$$\because F(0) = \left. \frac{dE_p}{dx} \right|_{x=0} = 0, \quad \left. \frac{dF}{dx} \right|_{x=0} = - \left. \frac{d^2 E_p}{dx^2} \right|_{x=0} = -k \quad (k > 0)$$

$\therefore$ 微振动： $F(x) \approx -kx$ （恢复力） $\Rightarrow$ 谐振动

例：
单摆
复摆

五、阻尼振动

- (无阻尼) **自由振动** —— 理想模型
(实际振动) **阻尼振动** —— 在**恢复力**和**阻力**共同作用下的振动
 摩擦阻尼 (发热)、 **辐射阻尼** (波动)

阻力 (低速): $f = -bv = -b \frac{dx}{dt}$, 恢复力: $F = -kx$

$$m \frac{d^2 x}{dt^2} = f + F = -b \frac{dx}{dt} - kx \quad \text{令: } \omega_0^2 = \frac{k}{m}, \quad \gamma = \frac{b}{2m}$$

$$\frac{d^2 x}{dt^2} + 2\gamma \frac{dx}{dt} + \omega_0^2 x = 0 \quad (\text{齐次常系数二阶微分方程})$$

ω_0 : 固有频率

γ : 阻尼系数

其解 (弱阻尼 $\gamma < \omega_0$): $x = A_0 e^{-\gamma t} \cos(\omega t + \varphi)$

A_0 、 φ 为积分常数 (由初始条件决定)

$A_0 e^{-\gamma t}$: 阻尼力作用下振幅的衰减

$\cos(\omega t + \varphi)$: 恢复力作用下的周期运动

阻尼振动频率

$$\begin{aligned} \omega &= \sqrt{\omega_0^2 - \gamma^2} \\ &= \sqrt{\omega_0^2 - \left(\frac{b}{2m}\right)^2} \end{aligned}$$

振幅： $A = A_0 e^{-\gamma t}$ (指数衰减)

准周期运动： $\omega < \omega_0$, $T > T_0$

阻尼振动频率

$$\omega = \sqrt{\omega_0^2 - \gamma^2} = \sqrt{\omega_0^2 - \left(\frac{b}{2m}\right)^2}$$

过阻尼： $\gamma > \omega_0$
 临界阻尼： $\gamma = \omega_0$
 (很快回到平衡位置)

六、受迫振动 共振

(1) 受迫振动 阻尼振动 —— 减幅振动
受迫振动 —— 在周期性外力作用下的振动

周期性外力： $F_0 \cos \omega t$ ， 阻尼力： $-b \frac{dx}{dt}$ ， 恢复力： $-kx$

$$m \frac{d^2 x}{dt^2} = -kx - b \frac{dx}{dt} + F_0 \cos \omega t \quad \text{令：} \omega_0^2 = \frac{k}{m} \quad \gamma = \frac{b}{2m}$$

$$\frac{d^2 x}{dt^2} + 2\gamma \frac{dx}{dt} + \omega_0^2 x = \frac{F_0}{m} \cos \omega t \quad (\text{非齐次常系数二阶微分方程})$$

$$x = A_0 e^{-\gamma t} \cos(\omega' t + \varphi_0) + A \cos(\omega t + \varphi)$$

齐次通解(瞬态解) + 非齐次特解(稳态解)

当 t 足够大, $e^{-\gamma t} \rightarrow 0$ 瞬态解 $\rightarrow 0$

$\therefore x = A \cos(\omega t + \varphi)$ 稳定受迫振动

(A 与 t 无关, ω 与周期性外力相同)

$$A = \frac{F_0 / m}{\sqrt{(\omega_0^2 - \omega^2)^2 + 4\gamma^2 \omega^2}}$$
$$\tan \varphi = \frac{-2\gamma \omega}{\omega_0^2 - \omega^2}$$

(2) 共振

$$\text{稳定受迫振动: } A = \frac{F_0/m}{\sqrt{(\omega_0^2 - \omega^2)^2 + 4\gamma^2\omega^2}} = A(\omega)$$

求振幅 A 的最大值 (共振振幅), 分母最小

$$\frac{d}{d\omega}[(\omega_0^2 - \omega^2)^2 + 4\gamma^2\omega^2] = -4(\omega_0^2 - \omega^2)\omega + 8\gamma^2\omega = 0$$

$$\omega_0^2 - \omega^2 = 2\gamma^2 \quad \text{共振频率: } \omega_{\text{共振}} = \sqrt{\omega_0^2 - 2\gamma^2}$$

$$\begin{aligned} \text{共振振幅: } A_{\text{共振}} &= \frac{F_0/m}{\sqrt{(\omega_0^2 - \omega_{\text{共振}}^2)^2 + 4\gamma^2\omega_{\text{共振}}^2}} \\ &= \frac{F_0/m}{\sqrt{(2\gamma^2)^2 + 4\gamma^2(\omega_0^2 - 2\gamma^2)}} = \frac{F_0/m}{2\gamma\sqrt{\omega_0^2 - \gamma^2}} \end{aligned}$$

当 $\gamma \rightarrow 0$ (无阻尼) $\omega_{\text{共振}} \rightarrow \omega_0$ $A_{\text{共振}} \rightarrow \infty$

$\omega \rightarrow \omega_0$ 容易产生共振

七、振动的合成

振动的合成 —— 一个质点(物体)同时参与多个振动(线性叠加)

(1) 同方向、同频率谐振动的合成

几何方法: $x_1 = A_1 \cos(\omega t + \varphi_1)$, $x_2 = A_2 \cos(\omega t + \varphi_2)$

同方向(合位移为代数和): $x = x_1 + x_2$, 同频率: 旋转矢量角速度相同

$$\angle \alpha = \pi - (\varphi_2 - \varphi_1)$$

$$\begin{aligned} A^2 &= A_1^2 + A_2^2 - 2A_1A_2 \cos[\pi - (\varphi_2 - \varphi_1)] \\ &= A_1^2 + A_2^2 + 2A_1A_2 \cos(\varphi_2 - \varphi_1) \end{aligned}$$

$$\begin{aligned} A &= \sqrt{A_1^2 + A_2^2 + 2A_1A_2 \cos(\varphi_2 - \varphi_1)} \\ \text{tg } \varphi &= \frac{A_1 \sin \varphi_1 + A_2 \sin \varphi_2}{A_1 \cos \varphi_1 + A_2 \cos \varphi_2} \end{aligned}$$

讨论:

$$x_1 = A_1 \cos(\omega t + \varphi_1), \quad x_2 = A_2 \cos(\omega t + \varphi_2)$$

$$A = \sqrt{A_1^2 + A_2^2 + 2A_1A_2 \cos(\varphi_2 - \varphi_1)}$$

(1)、当 $\Delta\varphi = \varphi_2 - \varphi_1 = \pm 2k\pi, \quad k = 0, 1, 2, \dots$

$\vec{A}_1 \parallel \vec{A}_2$ $A_{\max} = A_1 + A_2$ 最大值

(2)、当 $\Delta\varphi = \varphi_2 - \varphi_1 = \pm(2k+1)\pi, \quad k = 0, 1, 2, \dots$

$\vec{A}_1$ 与 $\vec{A}_2$ 反向平行, $A_{\min} = |A_1 - A_2|$ 最小值

(3)、一般情况下, $|A_1 - A_2| < A < A_1 + A_2$

$\therefore x = A \cos(\omega t + \varphi)$ 仍为与 x_1, x_2 同频率、同方向的谐振动。

$\therefore$ 可推广到多个同方向、同频率谐振动的合成。

例1:有两个振动方向相同的简谐振动, 其振动方程分别为: $x_1=4\cos(2\pi t+\pi)$ cm, $x_2=3\cos(2\pi t+0.5\pi)$ cm

(1) 求它们的合振动方程;

(2) 另有一个同方向的简谐振动 $x_3=2\cos(2\pi t+\varphi)$ cm ,

问当 φ 为何值时, x_1+x_3 为最大值? 当 φ 为何值时, x_1+x_3 为最小值?

分析:

(1) $x=5\cos(2\pi t+0.8\pi)$ cm

(2) 当 $\varphi=\pm 2k\pi+\pi$ 时, x_1+x_3 为最大值

当 $\varphi=\pm 2k\pi$ 时, x_1+x_3 为最小值

($k=0,1,2,3,\dots$)

例2: 设三个谐振动的表达式分别为 $x_1(t) = A_1 \cos \omega t$,

$$x_2(t) = A_2 \cos(\omega t + \delta) , \quad x_3(t) = A_3 \cos(\omega t + 2\delta) , \quad A_1 = A_2 = A_3 = A$$

试用旋转矢量法求出 $\delta = \frac{\pi}{2}, \frac{2\pi}{3}, 2\pi$ 时的合振动的振幅。

解: (1) $\delta = \frac{\pi}{2}$ 时

$$\therefore A_{\text{合}} = A$$

$$(2) \delta = \frac{2\pi}{3} \text{ 时}$$

$$\therefore A_{\text{合}} = 0$$

$$(3) \delta = 2\pi \text{ 时}$$

$$\therefore A_{\text{合}} = 3A$$

(2)同方向、不同频率谐振动的合成 拍

设两振动振幅相同

$$x_1 = A \cos(\omega_1 t + \varphi_1), \quad x_2 = A \cos(\omega_2 t + \varphi_2)$$

$$\begin{aligned} x &= x_1 + x_2 = A [\cos(\omega_1 t + \varphi_1) + \cos(\omega_2 t + \varphi_2)] \\ &= 2A \cos \frac{(\omega_2 t + \varphi_2) + (\omega_1 t + \varphi_1)}{2} \cos \frac{(\omega_2 t + \varphi_2) - (\omega_1 t + \varphi_1)}{2} \\ &= 2A \cos \frac{(\omega_2 - \omega_1)t + (\varphi_2 - \varphi_1)}{2} \cos \frac{(\omega_2 + \omega_1)t + (\varphi_2 + \varphi_1)}{2} \end{aligned}$$

不再是谐振动

若同初相 $\varphi_2 = \varphi_1 = \varphi$

$$x = 2A \cos \frac{\omega_2 - \omega_1}{2} t \cos \left(\frac{\omega_2 + \omega_1}{2} t + \varphi \right) = A' \cos \left(\frac{\omega_2 + \omega_1}{2} t + \varphi \right)$$

合振幅： $A' = 2A \cos \frac{\omega_2 - \omega_1}{2} t$ (随时间作周期性变化)

若 $|\omega_2 - \omega_1| \ll \omega_2 + \omega_1$ (ω_2 、 ω_1 都较大且相近)
_____ “拍”(合振幅变化的包络线)

拍频 $\nu_{\text{拍}}$ —— 单位时间内合振幅加强(或减弱)的次数

$$\begin{aligned}\text{合振动 角频率 } \omega' &= \frac{|\omega_2 - \omega_1|}{2} \\ \therefore \text{周期 } T' &= \frac{2\pi}{\omega'} \text{ 内合振幅加强二次} \\ \therefore \nu_{\text{拍}} &= \frac{2}{T'} = \frac{2}{2\pi/\omega'} = \frac{\omega'}{\pi} = \frac{|\omega_2 - \omega_1|}{2\pi} \\ &= |\nu_2 - \nu_1|\end{aligned}$$

$$\nu_{\text{拍}} = |\nu_2 - \nu_1|$$

(3) 互相垂直、同频率谐振动的合成

消去时间参数 t : 轨迹方程

$$\begin{cases} x = A_1 \cos(\omega t + \varphi_1) \\ y = A_2 \cos(\omega t + \varphi_2) \end{cases}$$

$$\frac{x}{A_1} \cos(\omega t + \varphi_2) - \frac{y}{A_2} \cos(\omega t + \varphi_1) = 0$$

$$\begin{aligned} \frac{x}{A_1} \sin(\omega t + \varphi_2) - \frac{y}{A_2} \sin(\omega t + \varphi_1) &= \cos(\omega t + \varphi_1) \sin(\omega t + \varphi_2) - \cos(\omega t + \varphi_2) \sin(\omega t + \varphi_1) \\ &= \sin[(\omega t + \varphi_2) - (\omega t + \varphi_1)] = \sin(\varphi_2 - \varphi_1) \end{aligned}$$

平方后得

$$\frac{x^2}{A_1^2} \cos^2(\omega t + \varphi_2) + \frac{y^2}{A_2^2} \cos^2(\omega t + \varphi_1) - \frac{2xy}{A_1 A_2} \cos(\omega t + \varphi_2) \cos(\omega t + \varphi_1) = 0$$

$$\frac{x^2}{A_1^2} \sin^2(\omega t + \varphi_2) + \frac{y^2}{A_2^2} \sin^2(\omega t + \varphi_1) - \frac{2xy}{A_1 A_2} \sin(\omega t + \varphi_2) \sin(\omega t + \varphi_1) = \sin^2(\varphi_2 - \varphi_1)$$

$$\frac{x^2}{A_1^2} + \frac{y^2}{A_2^2} - \frac{2xy}{A_1 A_2} \cos[(\omega t + \varphi_2) - (\omega t + \varphi_1)] = \sin^2(\varphi_2 - \varphi_1) \quad \text{椭圆方程}$$

$$\begin{cases} x = A_1 \cos(\omega t + \varphi_1) \\ y = A_2 \cos(\omega t + \varphi_2) \end{cases}$$

$$\frac{x^2}{A_1^2} + \frac{y^2}{A_2^2} - \frac{2xy}{A_1 A_2} \cos(\varphi_2 - \varphi_1) = \sin^2(\varphi_2 - \varphi_1) \quad \text{椭圆方程}$$

(1) $\varphi_2 - \varphi_1 = 0$ 同相

$$\frac{x^2}{A_1^2} + \frac{y^2}{A_2^2} - \frac{2xy}{A_1 A_2} = 0 \Rightarrow \frac{x}{A_1} - \frac{y}{A_2} = 0$$

$$\therefore y = \frac{A_2}{A_1} x \quad \text{直线方程} \quad \text{斜率: } \tan \theta = \frac{A_2}{A_1}$$

$$\text{距原点 } O \text{ 的位移: } r = \sqrt{x^2 + y^2} = \sqrt{A_1^2 + A_2^2} \cos(\omega t + \varphi_1)$$

$$\text{沿 } y = \frac{A_2}{A_1} x \text{ 直线上的谐振动, 振幅 } A = \sqrt{A_1^2 + A_2^2} \text{ 角频率 } \omega$$

(2) $\varphi_2 - \varphi_1 = \pm\pi$ 反相

$$\frac{x^2}{A_1^2} + \frac{y^2}{A_2^2} + \frac{2xy}{A_1 A_2} = 0 \Rightarrow \frac{x}{A_1} + \frac{y}{A_2} = 0$$

$$\therefore y = -\frac{A_2}{A_1} x \quad \text{直线方程} \quad \text{斜率: } \tan \theta = -\frac{A_2}{A_1}$$

$$r = \sqrt{A_1^2 + A_2^2} \cos(\omega t + \varphi_1) \quad \text{沿 } y = -\frac{A_2}{A_1} x \text{ 直线上的谐振动}$$

$$(3) \varphi_2 - \varphi_1 = \pm \frac{\pi}{2}$$

$$\frac{x^2}{A_1^2} + \frac{y^2}{A_2^2} = 1 \quad X、Y \text{ 轴为长短轴的正椭圆 } (A_2 = A_1 \text{ 圆})$$

$$\varphi_2 - \varphi_1 = \frac{\pi}{2} \quad \begin{cases} x = A_1 \cos(\omega t + \varphi_1) \\ y = A_2 \cos(\omega t + \varphi_1 + \frac{\pi}{2}) = -A \sin(\omega t + \varphi_1) \end{cases}$$

$$\text{当 } (\omega t_0 + \varphi_1) = 0 \quad \begin{cases} x = A_1 \\ y = 0 \end{cases} \quad \text{当 } t_0 + \Delta t \quad \begin{cases} x > 0 \\ y < 0 \end{cases} \quad \text{顺时针转动}$$

$$\varphi_2 - \varphi_1 = -\frac{\pi}{2} \quad \begin{cases} x = A_1 \cos(\omega t + \varphi_1) \\ y = A_2 \cos(\omega t + \varphi_1 - \frac{\pi}{2}) = A \sin(\omega t + \varphi_1) \end{cases}$$

$$\text{当 } (\omega t_0 + \varphi_1) = 0 \quad \begin{cases} x = A_1 \\ y = 0 \end{cases} \quad \text{当 } t_0 + \Delta t \quad \begin{cases} x > 0 \\ y > 0 \end{cases} \quad \text{逆时针转动}$$

(4) $\varphi_2 - \varphi_1$ 为任意值

$$\frac{x^2}{A_1^2} + \frac{y^2}{A_2^2} - \frac{2xy}{A_1 A_2} \cos(\varphi_2 - \varphi_1) = \sin^2(\varphi_2 - \varphi_1)$$

(4) 互相垂直、不同频率谐振动的合成

李萨如图:

一般运动轨迹不再成封闭曲线 (非周期性)

- 两个频率相差很小 —— 近似看成同频率的合成, 位相差缓慢变化
- 两个频率成简单的整数比 —— 合成运动轨迹稳定, 作周期性运动

$$\frac{\omega_y}{\omega_x} = \frac{\text{水平方向交点数}}{\text{竖直方向交点数}}$$

例：用旋转矢量法求两个相互垂直简谐振动的合成

设： $x = A \cos(\omega t)$ $y = A \cos(\omega t + \pi/4)$

作业:

5.47 5.51 5.53
