

例1: 已知: $f(v) = \frac{dN}{Ndv} = \begin{cases} kv^3 & (0 < v < v_0) \\ 0 & (v > v_0) \end{cases}$

求: (1)比例常数 k ; (2)粒子的平均速率 $\bar{v}$; (3) 速率在 $0 \sim 0.5v_0$ 之间的粒子的方均根速率; (4)速率在 $0 \sim v_1$ 之间的粒子数占总粒子数的1/16时, v_1 为多大?

例2: 3mol理想气体初始温度为 0°C , 使其等温膨胀为原体积的5倍, 然后等体加热, 使其末态压强恰好等于初态压强, 整个过程传给气体热量 $8 \times 10^4 \text{J}$ 。求: (1) $P-V$ 图; (2)该理想气体的自由度; (3)始末过程熵变。

例1: 已知: $f(v) = \frac{dN}{Ndv} = \begin{cases} kv^3 & (0 < v < v_0) \\ 0 & (v > v_0) \end{cases}$

求: (1)比例常数 k ; (2)粒子的平均速率 $\bar{v}$; (3) 速率在 $0 \sim 0.5v_0$ 之间的粒子的方均根速率; (4)速率在 $0 \sim v_1$ 之间的粒子数占总粒子数的1/16时, v_1 为多大?

解: (1). $\int_0^\infty f(v) \cdot dv = \int_0^{v_0} kv^3 dv = \frac{1}{4}kv_0^4 = 1, \quad \therefore k = \frac{4}{v_0^4}$

(2). $\bar{v} = \int_0^\infty vf(v)dv = \int_0^{v_0} kv^4 dv = \frac{1}{5}kv_0^5 = \frac{4}{5}v_0$

(3). $\sqrt{v_{0-\frac{1}{2}v_0}^2} = \left[\frac{\int_0^{\frac{1}{2}v_0} v^2 Nf(v)dv}{\int_0^{\frac{1}{2}v_0} Nf(v)dv} \right]^{1/2} = \left[\frac{\int_0^{\frac{1}{2}v_0} kv^5 dv}{\int_0^{\frac{1}{2}v_0} kv^3 dv} \right]^{1/2} = \sqrt{\frac{v_0^2}{6}} = \frac{\sqrt{6}v_0}{6}$

(4). $P(v) = \int_0^{v_1} f(v)dv = \int_0^{v_1} kv^3 dv = \frac{1}{4}kv_1^4 = \left(\frac{v_1}{v_0}\right)^4 = \frac{1}{16} \quad \therefore v_1 = \frac{1}{2}v_0$

热学课堂练习

例2: 3mol理想气体初始温度为 0°C ，使其等温膨胀为原体积的5倍，然后等体加热，使其末态压强恰好等于初态压强，整个过程传给气体热量 $8 \times 10^4 \text{ J}$ 。求：(1) $P-V$ 图；(2)该理想气体的自由度；(3)始末过程熵变。

解: $\because \frac{p_0 V_0}{T_0} = \frac{pV}{T} = \frac{p_0 (5V_0)}{T} \Rightarrow T = 5T_0$

$$Q_T = \nu R T_0 \ln \frac{V}{V_0} = \nu R T_0 \ln 5$$

$$Q_V = \nu C_V (T - T_0) = 4\nu C_V T_0$$

$$Q = Q_T + Q_V = \nu R T_0 \ln 5 + 4\nu C_V T_0$$

$$\therefore C_V = \frac{Q - \nu R T_0 \ln 5}{4\nu T_0} = 21.1 \text{ J/mol} \cdot \text{K} \quad \therefore i = \frac{2C_V}{R} = 5$$

$$\Delta S_p = \nu C_p \ln \frac{V_2}{V_1} = 3 \times \frac{7}{2} R \ln 5 = 140 \text{ J/K}$$
